One Engine, One Solution Infinite Possibilities

Sentinel

WHY ONE ENGINE

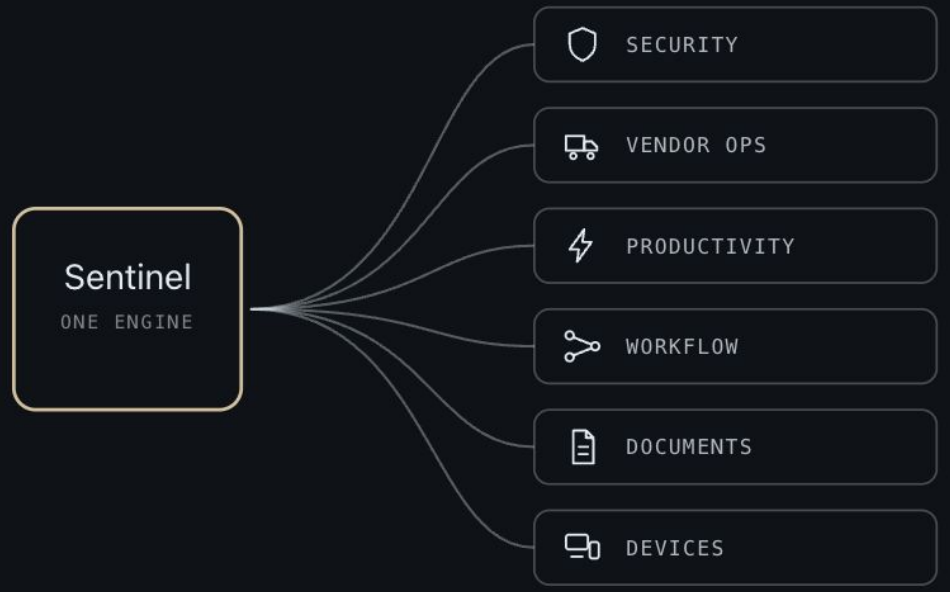

A platform per use case is a platform you rebuild every time.

Same work, two shapes. One costs you a system per objective; the other costs you a description.

A platform per use case

Separate agents, integrations, pipelines and systems to maintain, wired to each other and to the people in between. Every new objective is another set of wires to keep alive.

One engine

One runtime, pointed at any objective. Security, vendor mail, documents, devices: the results differ, the machinery does not.

THE PLATFORM

Six parts, one engine.

Each capability is a part of the same runtime, not a separate product.

Workflows

AXIS

Hive

BIFROST

Execution Ledger

Deliverables

THE PLATFORM

Six parts, one engine.

Each capability is a part of the same runtime, not a separate product.

01

Workflows

A plain-English goal becomes steps, dependencies, branches and rules.

```

Check who really sent it,
where each link resolves,
and what the message wants.
```

01 Read the message

02 Resolve every link

03 Draft the verdict

THE PLATFORM

Six parts, one engine.

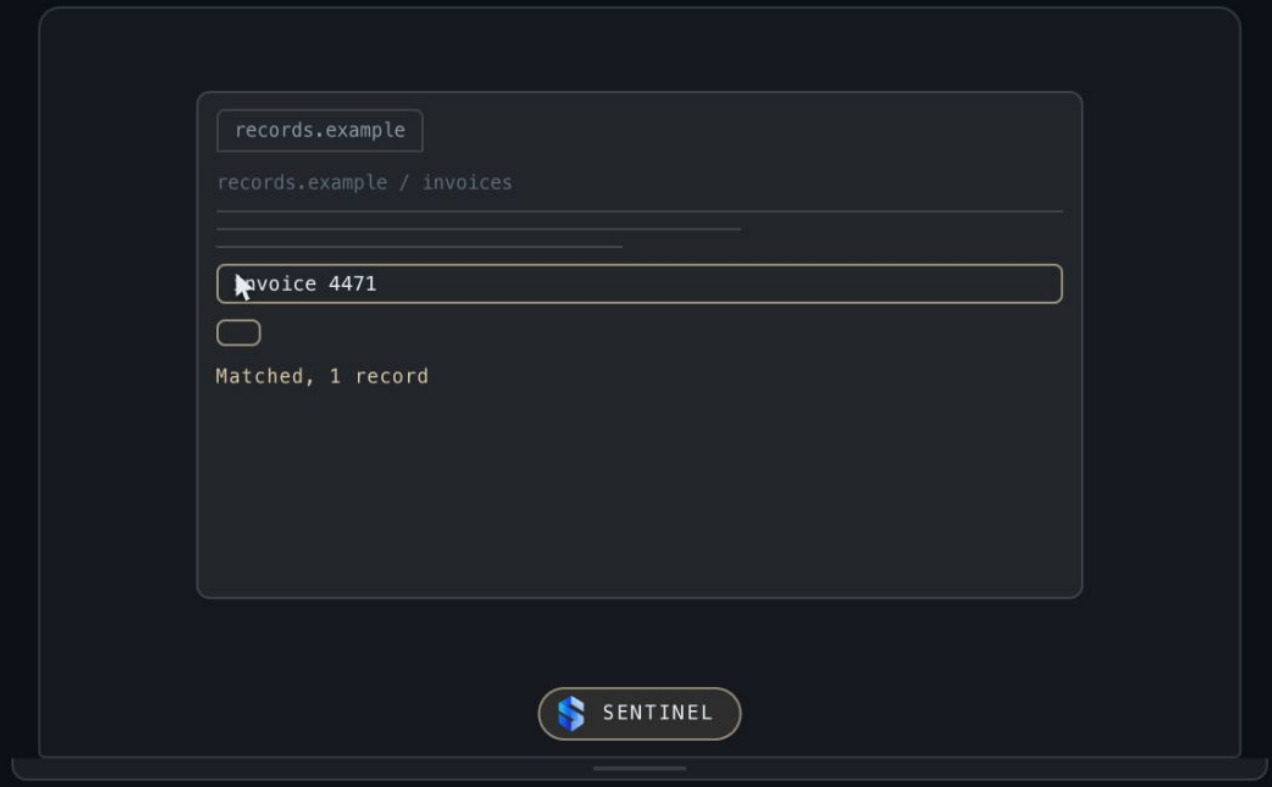

Each capability is a part of the same runtime, not a separate product.

02

AXIS

Autonomous eXecution IntelligenCe System

Reads the interface as text and acts by role and name, not by pixel.

THE PLATFORM

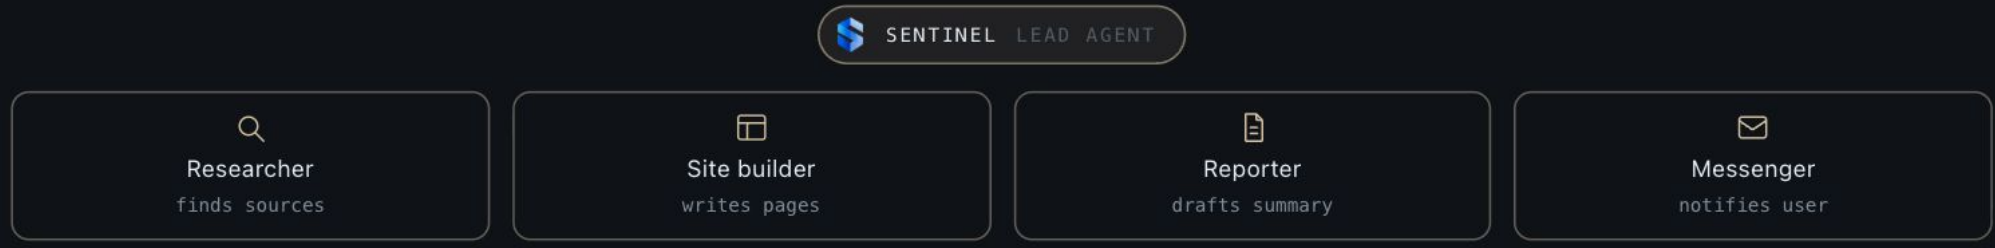

Six parts, one engine.

Each capability is a part of the same runtime,
not a separate product.

03

Hive

A lead agent plans, delegates to workers, and keeps desktop control central.

Each capability is a part of the same runtime,
not a separate product.

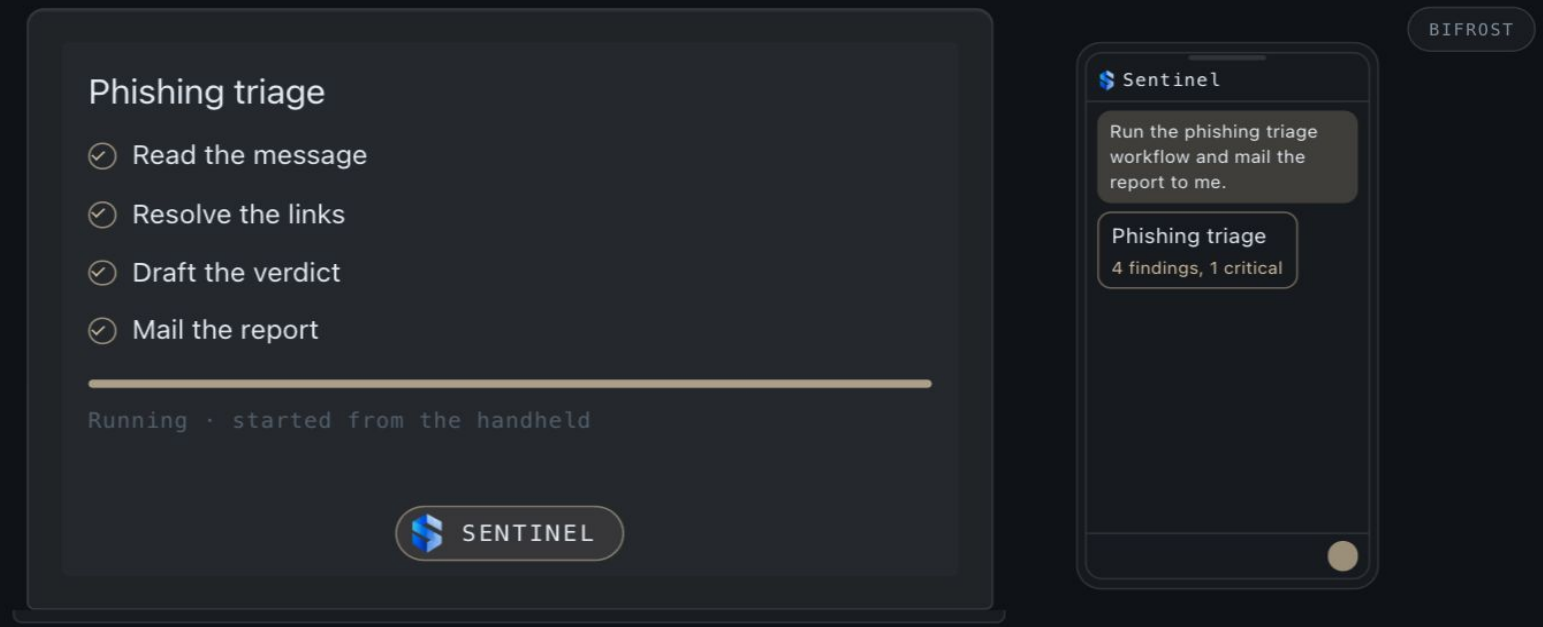

Six parts, one engine.

04

BIFROST

Bidirectional Inter-device Framework for
Remote Operations, Supervision and Tasking

Desktop and handheld, linked and controlled in
both directions.

THE PLATFORM

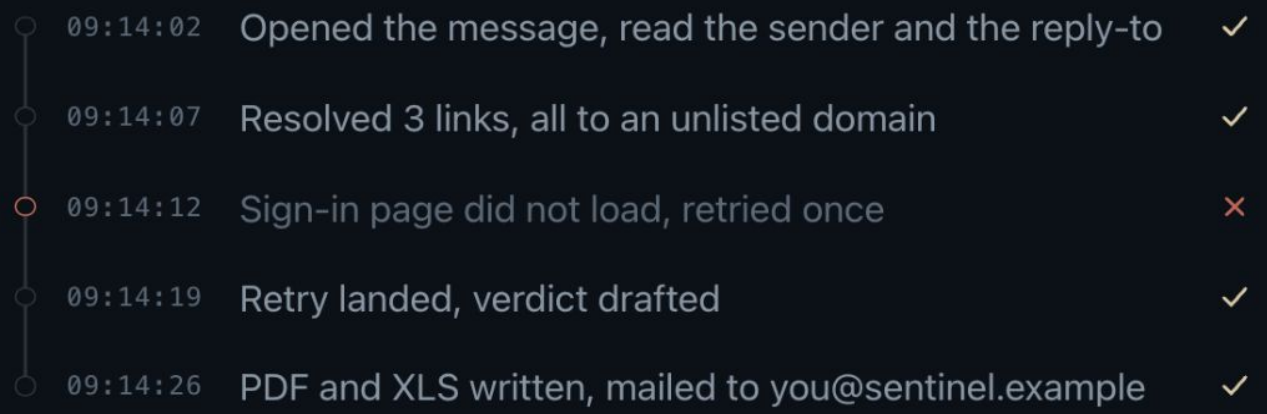

Six parts, one engine.

Each capability is a part of the same runtime, not a separate product.

05

Execution Ledger

Every action, outcome, timestamp and step status, on the record.

THE PLATFORM

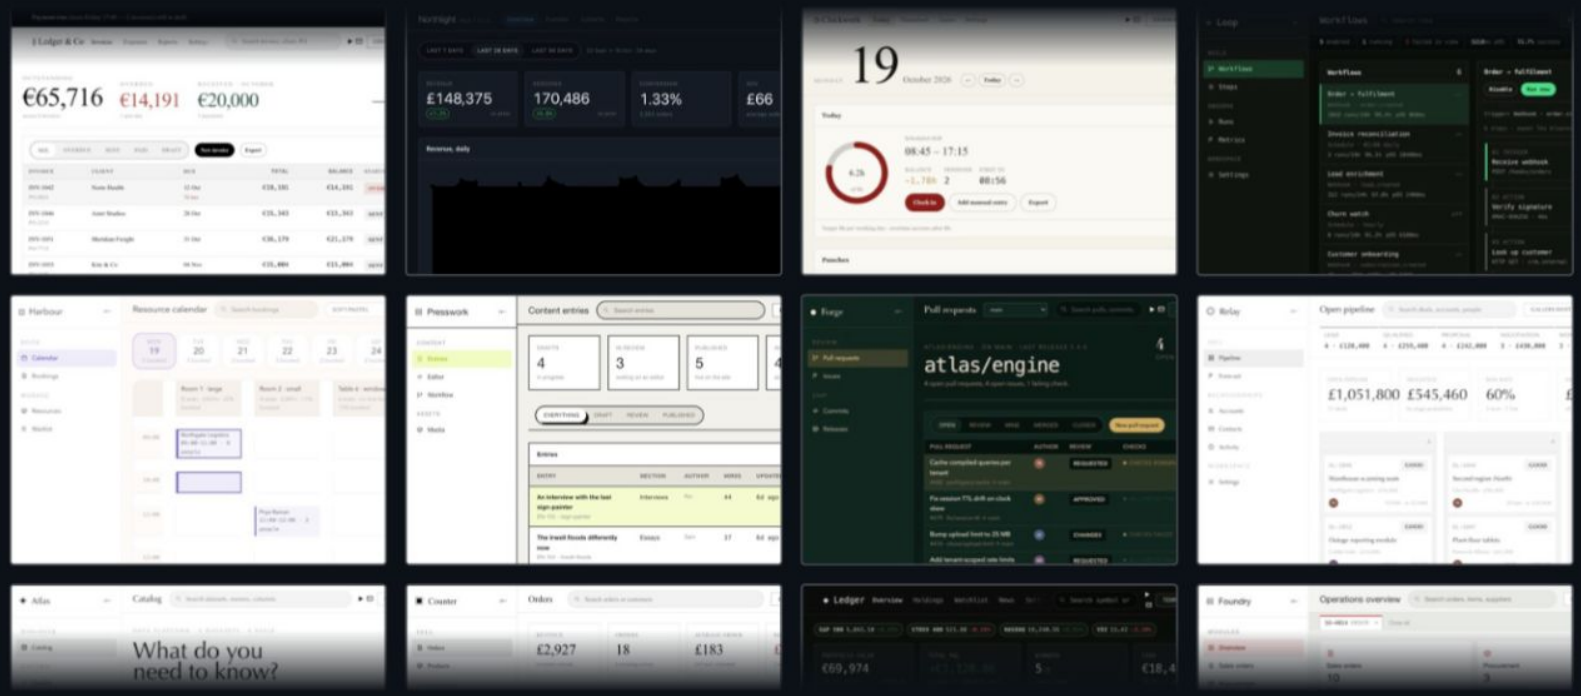

Six parts, one engine.

Each capability is a part of the same runtime, not a separate product.

06

Deliverables

Documents, decks and workbooks: an artefact, not a chat reply.

THE EXECUTION LOOP

Four moves from a sentence to a finished artefact.

The same loop carries a short task and a long-running job, on a desktop and on a handheld.

01
Describe

02
Compile

03
Orchestrate

04
Execute & deliver

01

Describe

State the goal in plain English. No code, no configuration language, no diagrams to maintain.

02

Compile

Workflow Compilation expands it into steps, dependencies, nested steps, parallel branches, loops and execution rules.

03

Orchestrate

Hive puts a lead agent in charge and delegates across agents. Work runs in parallel while desktop control stays centrally authorised.

04

Execute and deliver

AXIS works inside the applications the task lives in and verifies each result. Deliverable Generation returns the artefact; the ledger records the steps.

WHERE IT RUNS

The same engine, pointed at a different objective.

Six places it is applied today. The objective, inputs and rules change; compilation, orchestration, execution and the ledger do not.
