AUTONOMOUS EXECUTION PLATFORM

Sentinel

A plain-English goal becomes an execution plan, runs across real applications, and returns a finished deliverable with a record of every step.

Photograph: Unsplash, via Lorem Picsum

Intent in. Executed work out. A ledger that says what happened at every step.

Solution description for SDSI · October 2026

One engine, not one platform per use case

WITHOUT AN ENGINE

A platform per use case

— Each use case arrives with its own agent platform and its own integration work

— Agents and people are coordinated by hand

— No shared record of what ran, what failed or what was verified

WITH SENTINEL

A new workflow is a new use

— One engine compiles intent, executes it and accounts for it

— Hive plans and delegates while desktop control stays central

— The execution ledger holds actions, outcomes and timestamps

Six subsystems in four layers

INTENT & PLANNING

Workflow Compilation

Instructions become steps, dependencies, parallel branches and rules

Hive

A lead agent plans and delegates; desktop control stays central

EXECUTION & CONTROL

AXIS

Reads accessibility information from native apps, interacts and verifies as it works

REACH

BIFROST

Links handheld devices and desktops for remote access, supervision and tasking

OUTPUT & ACCOUNTABILITY

Deliverable Generation

Documents, presentations and spreadsheets, not a chat reply

Execution Ledger

Actions, outcomes, timestamps, step statuses; failures surface

From a written goal to a finished deliverable

01

Describe

A goal in plain English. No code and no configuration language.

02

Compile

Workflow Compilation builds steps, dependencies, parallel branches and execution rules.

03

Orchestrate

Hive plans and delegates to several agents; desktop control stays authorised centrally.

04

Execute and verify

AXIS works inside the applications the task lives in and verifies each result.

05

Deliver

The deliverable is produced from what execution gathered; the ledger records each step.

AXIS AND HIVE

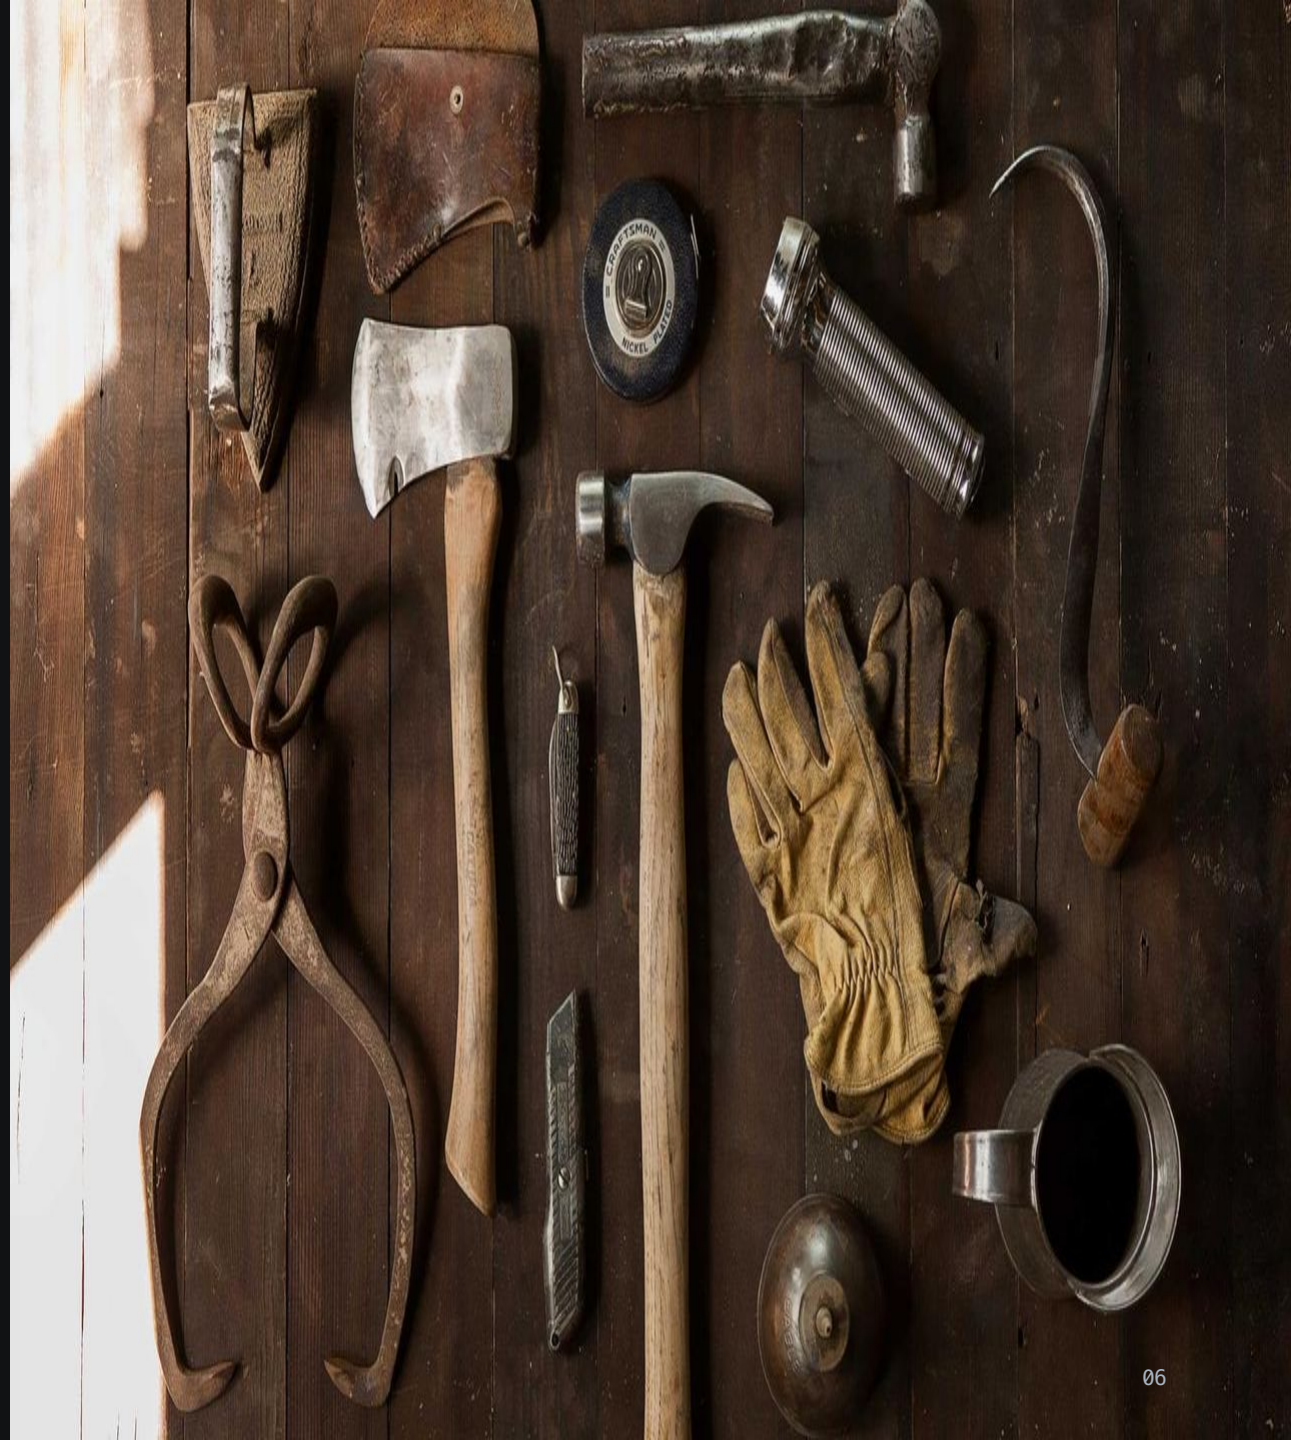

The desktop is the API.

AXIS reads accessibility information from the native interfaces of desktop applications. It identifies elements, interacts with them and verifies the result as it works.

Verification happens inside the same loop, so a step that did not land is caught rather than assumed.

- A lead agent plans the work and delegates to several agents
- Work runs in parallel while desktop control stays centrally authorised

BIFROST extends remote access, supervision and tasking to paired handheld devices.

Six categories, one engine

Category	What goes in	What comes out
Security	Suspicious email and message data	Phishing indicators, classification, review-ready findings
Vendor operations	Vendor correspondence	Extracted fields, classified requests, structured records
Productivity	Repetitive multi-step tasks across apps and sources	The completed task, not instructions
Workflow automation	A business procedure with steps and rules	An executed procedure with checkpoints
Document processing	Source material	Organised, usable business deliverables
Cross-device automation	A handheld and desktop pair, linked by BIFROST	Remote control, supervision and tasking in both directions

Only the objective, the inputs and the rules change from row to row.

Counted, not estimated

EXECUTION SUBSYSTEMS

6

intent to audit trail

Workflow Compilation, Hive, AXIS, BIFROST, Deliverable Generation, Execution Ledger

BUSINESS CATEGORIES

6

same engine in each

Security, vendor operations, productivity, workflow, documents, cross-device

WORKING WORKFLOWS

2

built in two days

Phishing triage and vendor mail

DAYS TO BUILD THEM

2

one after the other

Day 1 phishing triage, Day 2 vendor mail

Two working workflows in two days

Day 1

Phishing triage

Processes email data, classifies messages against defined criteria and organises the results into deliverables.

Day 2

Vendor mail

The same platform approach on vendor correspondence: extracted fields, classified requests, structured records.

D–Day

Additional workflows

More workflows on the same engine, extending it across the six categories.

IN CLOSING

One platform. One solution. Infinite possibilities.

01 Describe the work: plain English in, compiled workflow out

02 One engine, not one platform per use case

03 Results with an auditable record of every step

Start with two workflows

- Pick the two pilot workflows with SDSI
- Baseline the four measures: completion time, manual intervention, execution accuracy, effort per workflow
- Review the execution ledger after the pilot

No results are claimed yet. The pilot is where the four measures begin.
